

SOLUTION FILE 1: UI POLICY DYNAMIC FIELD MANAGEMENT SOLUTION

Project Title: Implement Client Script & UI Policy (Incident)

1. Solution Overview

The primary objective of this solution is to resolve form clutter and ensure proper data collection during incident creation. Instead of exposing all fields statically, this solution leverages ServiceNow's **UI Policy Engine** to dynamically control field visibility, mandatory requirements, and read-only states based on user input.

2. Implementation Strategy & Configuration

- **Trigger Condition:** Defined at the Incident table (incident) level (e.g., when Category equals Software or Hardware).
- **UI Policy Actions Configured:**
 - **Visibility Control:** Fields such as *Error Code* or *Device ID* are set to Visible = True only when the relevant category is chosen; otherwise, they remain hidden.
 - **Mandatory Enforcement:** Critical fields like *Short Description* and specific category-dependent fields are programmatically forced to be mandatory without writing server-side code.
 - **Read-Only States:** Configuration-sensitive fields are locked down to prevent unauthorized user tampering.

3. Benefits of Solution 1

- Eliminates user confusion by displaying only contextually relevant fields.
- Streamlines form rendering speed and improves user experience (UX) on the ServiceNow Service Portal.
