

SOLUTION FILE 2: CLIENT SCRIPT VALIDATION & AUTOMATION SOLUTION

Project Title: Implement Client Script & UI Policy (Incident)

1. Solution Overview

This solution implements client-side JavaScript automation using ServiceNow's **GlideForm (g_form) API** and **GlideUser (g_user) API** to validate data inside the user's browser in real time before it reaches the database server.

2. Implementation Strategy & Script Types

- **onLoad Client Script:**
 - *Purpose:* Executes automatically when the Incident form loads in the browser.
 - *Action:* Automatically sets default values (e.g., setting initial caller details or displaying a helpful welcome/guidance alert banner).
- **onChange Client Script:**
 - *Purpose:* Triggers instantly when a specific field value changes (e.g., changing the *Urgency* or *Impact* field).
 - *Action:* Dynamically calculates or validates the relationship between urgency and priority, or auto-fills related reference fields.
- **onSubmit Client Script:**
 - *Purpose:* Executes right when the user clicks the "Submit" or "Save" button.
 - *Action:* Performs final mandatory checks (e.g., verifying that description boxes are not empty or contain valid patterns). If validation fails, it aborts submission (false) and displays a clear error warning popup.

3. Benefits of Solution 2

- Stops erroneous or incomplete data entries at the browser level before network transmission.
- Reduces database cleanup overhead for system administrators.
