

FILE 2: USER ACCEPTANCE TEST (UAT)

Project Title: Implement Client Script & UI Policy (Incident)

1. UAT Introduction & Objectives

1.1 Purpose of UAT

User Acceptance Testing (UAT) is the final phase of development where the Incident Management form configured with UI Policies and Client Scripts is evaluated against real-world user scenarios. This ensures that the system meets all functional requirements defined in our Naan Mudhalvan project scope.

1.2 UAT Scope

- Testing mandatory field enforcement under various category conditions.
- Validating script behavior during form submissions and edits.
- Confirming overall usability from an end-user and service desk agent perspective.

2. Detailed UAT Test Cases & Execution Matrix

Test ID	Test Scenario	Expected Result	Actual Result	Status
TC-01	Open new Incident form	Form loads with default values and welcome alert (onLoad)	Form loaded successfully with defaults	PASS
TC-02	Select Category as 'Software'	UI Policy dynamically reveals Software Error fields	Fields appeared instantly	PASS
TC-03	Modify Urgency field	onChange script validates and adjusts priority matrix	Script executed correctly	PASS
TC-04	Submit form with empty Description	onSubmit script blocks submission and displays error	Submission blocked with alert	PASS
TC-05	Submit form with valid details	Record successfully committed to incident table	Saved to database table	PASS

3. Stakeholder Feedback & Sign-Off

3.1 Team Review Summary

- **Team Lead (Annesia J):** Verified overall architectural flow and script integration.
- **Team Members (Subitha P, Vanapetchi M, P Govika, Arisha Ponkumar Nadar):**
Executed individual module checks for mandatory enforcement, reverse conditions, and form updates, confirming flawless execution.

UAT Conclusion

All test cases executed successfully without errors. The solution completely resolves the initial problem of static form clutter and unvalidated data submissions.
