

PROJECT TITLE: IMPLEMENT CLIENT SCRIPT & UI POLICY (INCIDENT)

1. CUSTOMER JOURNEY (Requirement Analysis)

1.1 Overview of Customer Journey

The Customer Journey maps the end-to-end experience of a user (Employee/Reporter) and a Service Desk Agent interacting with the ServiceNow Incident Management module. It highlights how the integration of **Client Scripts** and **UI Policies** transforms a frustrating manual process into a smooth, automated workflow.

1.2 Journey Stages

1. Stage 1: Recognizing an IT Issue

- *User Action:* An employee faces a system breakdown or software error.
- *Pain Point:* Panic or uncertainty about how to report it correctly.

2. Stage 2: Accessing the ServiceNow Incident Portal

- *User Action:* Opens the ServiceNow portal and navigates to "Create New Incident".
- *Traditional State:* Overwhelmed by a static form with too many irrelevant fields.
- *Optimized State (Our Project):* **UI Policies** dynamically clean the form, showing only relevant fields based on the selected category.

3. Stage 3: Filling and Validating Data

- *User Action:* Enters short description, details, and selects urgency.
- *Traditional State:* Submits incomplete details, leading to errors.
- *Optimized State (Our Project):* **Client Scripts (onChange, onSubmit)** run instant checks in the browser, validating mandatory fields and formats before submission.

4. Stage 4: Successful Submission & Routing

- *User Action:* Clicks submit and receives a confirmation message.
- *Outcome:* Accurate data hits the database, allowing Service Desk agents to prioritize and resolve the ticket swiftly without back-and-forth emails.

5.Customer Journey Flowchart

Plaintext

[Stage 1: Recognizing Issue] —> Employee faces a system breakdown or software error.

[Stage 2: Accessing Portal] —> Opens ServiceNow Incident Portal.

└→ [Traditional]: Overwhelmed by static, cluttered forms.

└→ [Our Project]: UI Policies dynamically clean the form layout.

[Stage 3: Data Entry & Check] —> Enters description & selects urgency.

└→ [Traditional]: Submits incomplete data, leading to errors.

└→ [Our Project]: Client Scripts (` onChange` / ` onSubmit`) run instant browser checks.

[Stage 4: Submission & Routing] —> Clicks Submit successfully.

[Result] —> Clean record hits DB; Service Desk resolves ticket swiftly without back-and-forth emails.
