

# PROJECT TITLE: IMPLEMENT CLIENT SCRIPT & UI POLICY (INCIDENT)

## **2. DATA FLOW DIAGRAM (Requirement Analysis)**

### **2.1 Introduction**

The Data Flow Diagram (DFD) illustrates how data moves through the ServiceNow system during incident creation, highlighting where client-side automation (Scripts and Policies) intercepts and secures the data flow.

### **2.2 Data Flow Steps**

#### **1. User Input Phase:**

- The user enters data into the ServiceNow Incident Form fields (e.g., Category, Urgency, Short Description).

#### **2. Client-Side Interception (UI Policy & Client Script Layer - *Our Focus*):**

- **UI Policy Engine:** Evaluates form conditions in real-time, dynamically setting fields to Mandatory, Read-only, or Visible/Hidden.
- **Client Script Engine (onChange / onSubmit):** Executes JavaScript locally in the user's browser. If validation fails (e.g., mandatory field is empty), submission is blocked instantly with an error alert.

#### **3. Server-Side & Database Phase:**

- Once client-side validations pass successfully, the clean data package is transmitted across the network to the ServiceNow database server for record creation and assignment.
