

PROJECT TITLE: IMPLEMENT CLIENT SCRIPT & UI POLICY (INCIDENT)

3. SOLUTION REQUIREMENT (Requirement Analysis)

3.1 Functional Requirements

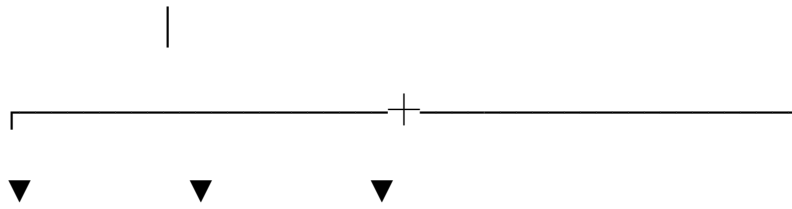

- **FR-01 (UI Policy):** The system must dynamically show or hide specific incident form fields based on the selected Category value.
- **FR-02 (UI Policy):** The system must enforce mandatory status on specific fields (e.g., Close Notes when state changes to Closed) without server reloads.
- **FR-03 (Client Script - onChange):** When the "Urgency" or "Priority" field changes, a script must trigger to validate alignment or auto-populate related tracking fields.
- **FR-04 (Client Script - onLoad):** The form must display a custom welcome message or adjust layout configurations automatically upon loading.
- **FR-05 (Client Script - onSubmit):** The form must prevent saving/submitting if validation criteria fail, displaying a clear warning popup to the user.

3.2 Non-Functional Requirements

- **Performance:** Client-side scripts must execute within milliseconds without slowing down browser rendering.
- **Usability:** The interface must provide instant, intuitive visual feedback for errors.
- **Maintainability:** Code scripts must be well-commented and structured inside the ServiceNow Studio IDE.

4. Solution Requirement Flowchart

[Project Requirement Goals]

[UI Policies] [Client Scripts] [Non-Functional]

- FR-01: Dynamic - FR-03: onChange - Performance: Fast

Show/Hide fields validation/auto-fill browser execution

- FR-02: Enforce - FR-04: onLoad default - Usability: Instant

mandatory states values/welcome alerts visual feedback

- FR-05: onSubmit block - Maintainability:

on validation failure Clean script design
